

Education in Australia

The central feature of education in the 21st Century is the need for students and teachers to intelligently research and explore new ways of thinking and learning.

Video Distribution

Video distribution is the management of media from a central or distribution storage location to multiple points of access.

Traditional distribution systems presented information in a format that was devoid of user interaction.

With the advent of faster computers and larger storage devices, video distribution systems have become far more open and useful with a greater degree of control and usability.

As a result video distribution has recently seen an explosion of media integration and interactivity and a greater degree of user-friendly technology.

Outdated Technology

As outdated methods in the workplace become obsolete or uneconomical, methods and tools of teaching must advance with modern technology to provide a solid foundation to the next generation workforce. Teachers and students must have an appreciation and understanding of these technologies.

Just as the computer has outdated the typewriter, future technologies will overshadow current workplace tools. It is so important that the next generation of students is in a position to appreciate and utilize these future advancements and developments for the benefit of mankind.

It is important that teachers interact and communicate with students to instil a sense of appreciation of change for the benefit of humankind.

It is vitally important for the future of Australia that we embrace new concepts and ideas because our country's very existence to compete worldwide is defined by the design, manufacture and production of cheap offshore items from overseas countries such as India and China.

Our Future

Today, and in the future, our ability to economically survive and compete with countries that have such an abundance of labour will depend on our creativity, intellectuality and perseverance. Where our earning ability equates to our learning ability.

Australia's future has never before relied so heavily on our educational institutes' ability to create a generation of far thinking, creative and intellectually challenging

students. They have inherited a world where the survival scales are balanced by intellect versus labour.

It is vital that teachers have the right tools and curriculum to mould this new generation of students who will advance Australia towards a technologically capable country.
